

CHO-B7H3 CHO-B7H3 | 305417

CHO-B7H3

Description

CHO-B7H3 is a cell line derived from CHO cells. It is characterized by its ability to produce and secrete recombinant proteins. The cell line is maintained in suspension culture and is highly adaptable to various growth conditions. It is commonly used in biotechnology for the production of monoclonal antibodies and other recombinant proteins.

CHO-B7H3 cells are derived from CHO cells (Chinese hamster ovary cells) and are characterized by their ability to produce and secrete recombinant proteins. The cell line is maintained in suspension culture and is highly adaptable to various growth conditions. It is commonly used in biotechnology for the production of monoclonal antibodies and other recombinant proteins.

Organism CHO

Tissue CHO

CHO-B7H3

Age CHO

Gender CHO

Morphology CHO

Growth properties CHO

CHO-B7H3

Citation CHO-B7H3 (305417)

Biosafety level 1

NCBI_TaxID 10029

GMO Status CHO-B7H3-S1: CHO

CHO-B7H3

Receptors expressed B7H3 (CD276)

Product sheet

CHO-B7H3 CHO-B7H3 | 305417

Incubation Atmosphere 37 °C, 5% CO₂, humidified

Flask Coating Cell culture medium

Freezing Procedure Harvest cells, wash with PBS, resuspend in freezing medium, aliquot into 1 ml vials, freeze at -80 °C

Shipping Conditions Dry ice, -80 °C

Storage Conditions -150 °C to -196 °C

CHO-B7H3 / CHO-B7H3 / HLA

Sterility Sterile, PCR negative
