

Product sheet

HFF-1 | 305790

General Information

Description HFF-1 (Human Foreskin Fibroblasts) is a cell line derived from foreskin tissue (hESCs) and is maintained in the presence of FGF-2 and activin A. HFF-1 cells are fibroblastic in morphology and are used for various applications in cell biology and tissue engineering. HFF-1 cells are derived from foreskin tissue (hESCs) and are maintained in the presence of FGF-2 and activin A. HFF-1 cells are fibroblastic in morphology and are used for various applications in cell biology and tissue engineering.

Organism Human

Tissue Foreskin, Skin

Synonyms HFF1

Characteristics

Age 1-3 years

Gender Male

Morphology Fibroblastic

Cell type Fibroblast

Growth properties Adherent

References

Citation HFF-1 (ATCC CCL-3285) Cytion 305790

Biosafety level 1

NCBI_TaxID 9606

CellosaurusAccession CVCL_3285

Additional Information
